Cable Stripping with One Turn of the Hand: JOKARI's PC-CAT strips wires and cables

Ascheberg / Frankfurt, April 11th, 2010. Heaps of tangled cables are a thing of the past: nowadays, data communication and network cables are cleverly hidden away behind decorative rails, under masonry, or under plaster. With the PC-CAT, JOKARI, the market leader for cable stripping and de-insulating technology from Ascheberg, has developed a tailor-made stripping tool for PVC-insulated data communication and network cables. The PC-CAT makes the quick and precise stripping of cables and wires effortless, without damaging the shielding in the cables.

All standard data and network cables with diameters from 4.5 to 10 mm, such as CAT5, CAT6, CAT7 or Twisted-Pair cables, can be stripped with a single turn of the hand: a quarter turn to the left or right, and the cable stripper cuts the external insulation before it can be removed in one effortless motion. No adjustment of the cutting depth to the correct diameter is required. The blade is designed to ensure that the critical shielding on the inside of the cable is not damaged. With its TÜV and GS-certificates, the PC-CAT also offers exceptional protection for its user. An additional blade is available for stripping individual wires from 0.2 to 4 mm².

At only 45 grams in weight and an overall length of 125 mm, including the clip for attaching the tool to one's work clothes, the PC-CAT is the ultimate mobile solution that is available wherever it is needed: on building sites, at work, or at home.
